- SUBUNIT: Probably a dodecamer composed of six biotin alpha subunits and six beta subunits.
- SUBCELLULAR LOCATION: Mitochondrial matrix.
- DISEASE: Defects in MCCC1 are the cause of 3-methylcrotonylglycinuria type I (MCGI, CGA or CG2). recessive disease that is characterized by muscular atrophy, probably of spinal origin.

"A tomato cDNA encoding a biotin-binding protein.";
Nucleic Acids Res. 15:3928-3928(1987).
-I- FUNCTION: THIS PROTEIN IS A COMPONENT OF THE ACETYL COENZYME A
CARBOXYLASE COMPLEX; FIRST, BIOTIN CARBOXYLASE CATALYZES THE
CARBOXYLATION OF THE CARRIER PROTEIN AND THEN THE TRANSCARBOXYLASE
TRANSFERS THE CARBOXYL GROUP TO FORM MALONYL-COA.

TRANSFERS THE CARBOXYL GROUP TO FORM MALONYL-COA.

-I- PATHWAY: Long-chain fatty acid biosynthesis; first step.
-I- SUBCELLULAR LOCATION: Chloroplast.
                                                                                                                                                                                                                                                                                    Fatty acid

-II- FUNCTION: THIS PROTEIN IS A COMPONENT OF THE ACETYL COENZYME A
-II- CARBOXYLASE COMPLEX; FIRST, BIOTIN CARBOXYLASE CATALYZES THE
CARBOXYLATION OF THE CARRIER PROTEIN AND THEN THE TRANSCARBOXYLASE
TRANSFERS THE CARBOXYL GROUP TO FORM MALONYL-COA (BY SImilarity).

-1- FUNCTION: PYRUVATE CARBOXYLASE CATALYZES A 2-STEP REACTION,
INVOLVING THE ATP-DEPENDENT CARBOXYLATION OF THE COVALENTLY
ATTACHED BIOTIN IN THE FIRST STEP AND THE TRANSFER OF THE
CARBOXYL GROUP TO PYRUVATE IN THE SECOND.

-1- CATALYTIC ACTIVITY: ATP + pyruvate + HCO(3)(-) = ADP + phos
                                                                                                                                                                                                                                                                                                                               MEDLINE-97377993; PubMed-9234674;

It contains multiple copies of three enzymatic components: pyruvate dehydrogenase (E1), dihydrolipoamide acetyltransferase (E2) and lipoamide dehydrogenase (E3).

-I- CATALYTIC ACTIVITY: Acetyl-CoA + dihydrolipoamide = CoA + S-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         "Complete genome sequence of Pseudomonas aeruginosa PAO1, opportunistic pathogen.";

PROCED STATEMENT OF THE FIRST STEP AND THE COVALENTLY

ATTACHED BIOTIN IN THE FIRST STEP AND THE TRANSFER OF THE CARBOXYL GROUP TO PYRUVATE IN THE SECOND. CATALYZES IN A TISSUE SPECIFIC MANUER, THE INITIAL REACTIONS OF GLUCOSE (LIVER, KIDNEY)

AND LIPID (ADIPOSE TISSUE, LIVER, BRAIN) SYNTHESIS FROM PYRUVATE.

-I- CATALYTIC ACTIVITY: ATP + pyruvate + HCO(3)(-) = ADP + phosphate +

J. Biochem. 244:352-360(1997).

FUNCTION: The pyruvate dehydrogenase complex catalyzes the overall conversion of pyruvate to acetyl-coa and CO(2). It contains multiple copies of three enzymatic components: pyruvate dehydrogenase (E1), dihydrolipoamide acetyltransferase (E2) and lipoamide dehydrogenase (E3).

CATALYTIC ACTIVITY: Acetyl-Coa + dihydrolipoamide = Coa + S-acetyldihydrolipoamide.
                                                                                                                                                                                                                                                                                                                        acetyldihydrolipoamide.
COFACTOR: THE E2 COMPONENT CONTAINS THREE COVALENTLY-BOUND LIPOYL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                J. I. J. Bacteriol. 176:4394-4408(1994).

I. Bacteriol. 176:4394-4408(1994).

I. PINCTION: The pyruvate dehydrogenase complex catalyzes the over conversion of pyruvate to acetyl-CoA and CO(2). It contains conversion of pyruvate enzymatic components: pyruvate dehydrogenase (E1), dihydrollpoamide acetyltransferase (E2) and lipoamide dehydrogenase (E3).

I. C. I. CAPILYIT ACTIVITY: Acetyl-CoA + dihydrollpoamide = CoA + S-acetyldihydrollpoamide.

I. COPACTORS (BY SIMILARITY).

C. SUBUNIT: FORMS A 24-POLYEPTIDE STRUCTURAL CORE WITH OCTAHEDRAL SYMMETRY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 On.
     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score
